

Transmission of Near Infrared light versus Visible light and thermal cameras

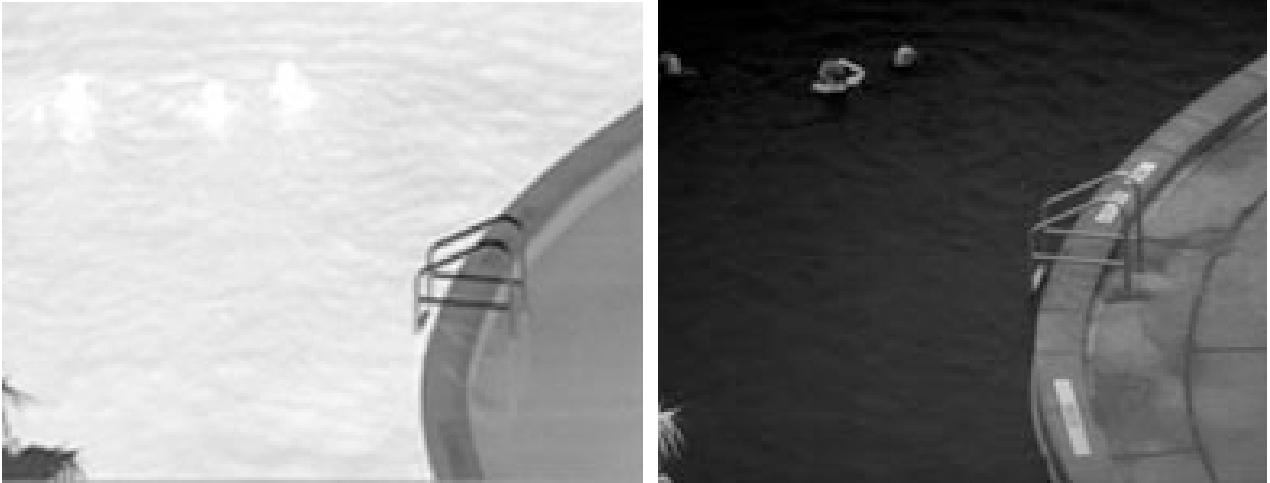

This is comparisons with cameras operating in SW-IR areas of spectra at 1-2 micron.

Left CCD in visible light of spectra. Right same image but in near IR areas

Daylight impression. Right view of area in visible spectra. Left zoom up of a part of the viewed area.

Right image from a thermal camera and cooled down persons in the water
Right image same in near IR spectra and far better details.
