

Gated viewing Lynx cameras

*Images of outputs of the camera
Intruder detection of a person*

Man on a pier in the illuminated zone of the gated camera system. Depth is about 10 meter which is illuminated and the man is about 35 meter away. There is boat behind the man but it can not be viewed as it is discriminated away by the gated camera distance setting.

Image appears a bit oversaturated as the syntectic cloths gives a good IR reflex.. The man carry an optical assembly and this appears a bit whiter than the rest of the image

Same place and same man with same view but here we illuminate the boat behind the man and he is in the darkness if front of the illuminated field of view.

The man appears like a black shadow in front of the boat. This is what we call negative image viewing.

This type of viewing is often the most clear when an intruder is searched as contracts are so sharp and strong

Many of our productr are protected by patents and patent applications
