

*Man 200 meter away behind a boat at shore in winter time. The man is in the illuminated zone and appears white. Left him there are the actual boats within the set depth of about 10 meter. Pls note some curtains are partially transparent as the laser light can pass through. If careful you can see a man behind a curtain if the curtain is not too dense or dark*

*Man moved 2-3 meter left and we moved the illuminated zone to be behind the man. The man appears as a black shadow on a white surface and is clearly visible.*

*Same position but here the man is in the illuminated zone and carry a camera optics in the hand. The cat eye reflex is clearly visible as a brighter spot.*

*Opto finder functions are very efficient and it is easy to see someone with goggles or telescopes looking at you from a dark point.*

*This is a cut out of the larger images showing the clear image and resolution. This is about 200 meter away and filed of view is 7,5 degree of the gated camera.*
