

Ready to install!

Container with LED Lamppost - all included for a street

LED Lamp armature

Container

Batteries

Windspin

Lampposts

Fondations
for the posts

Cable

Tellux has developed a total concept for green electricity for areas that are difficult to reach with traditional electricity.

The entire system is delivered in a container that contains whatever is needed in order to start up electricity deliveries and for streetlights.

The electricity can be used for power to all types of needs.

When everything is installed the container is used as the basis station for all instruments.

In the container, the batteries are placed, and outside the container the sun panels.

The vindmill is assembled through the container with accompanying post and in this way becomes the container the basis station for the power.

This is included in a container: Complete vindspin, lampposts, armature, foundations for the posts, batteries, solar panels and cable.
